The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in an animal, which is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains used to create the
                                                                                                                                                                                                                                                                                                                                                                              Sequence

The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in a state of the present sequence represents the human is the sequence of the present sequence represents the human is the sequence of the present sequence represents the human is the sequence of the present sequence represents the human is the sequence of the present sequence represents the human is the sequence of the present sequence represents the human is the sequence of the present sequence of the pres

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B
                     This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IGE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IGE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal is immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IGE in an animal, which is useful for downregulating autologous IGE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IGE heavy chain C2-C3-C4 domains optimised for expression in an E. Coli system, this sequence was used to create the epitopes of the

The resultant protein produced contains some non-Fc amino acids. These were removed by replacing their coding sequence with a bicistronic linker. The resultant construct encodes the Fc(epsilon) constant heavy region from amino acids 226-547. When it is expressed in E.coli, the protein produced is a non-glycosylated Fc(epsilon) fragment. Altering the pattern of glycosylated Fc(epsilon) induces a thus rendering the Fc fragment immunogenic and able to induce antibodies that recognise native IGE but do not form histamine-releasing complexes. The Fc fragments can be used in anti-allergenic vaccines to modulate the intensity of immune responses

The sequence is preferably mutated (see AAR75225) to represent a protein encoding a protein where Cys225 is mutated, optionally together with Val224, Ser226 and Arg227. The protein is useful in the study and treatment of allergy.

It was used to construct a number of immunogenic peptides which consisted of regions of IqE from different mammals, which appear to cause a stronger polyclonal anti-self IqE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C1-C2-C3-C4 domains used to create the

constant region. The invention is based on the discovery that a CC polypeptide that includes the CH1 (i.e. constant domain 1 in the CH2 cyclain) and/or CH4 domain(s) of an IgE molecule, coupled to a CC carrier, can be used to induce in a mammal the production of antibodies that specifically bind to IgE of the mammal. Compositions are provided for inducing self-specific anti-IgE antibodies. These contain carriers foreign to the immunised mammal coupled to polypeptides containing fragments of the IgE molecule, coupled to polypeptides containing fragments of the IgE molecule, coupled to polypeptides containing fragments of the IgE molecule, coupled to polypeptides containing fragments of the IgE molecule, composition acids 1-110, 105, 5-105 or 5-95 of the present sequence, but not the CH3 domain. CH1 polypeptides have at least 95% identity to amino acids 133-428, 313-425, 317-428 or 317-425 of the present sequence. The compositions have at least 95% identity to amino acids 313-428, 313-425, 317-428 or 317-425 of the present sequence. The compositions reduce or eliminate the pool of free IgE in the mammal's serum. Alternatively, a polynucleotide encoding a fusion CC administered. The compositions and polynucleotides are used to inhibit or treat IgE-mediated disorders such as anaphylactic conditions, allergic rhinitis or conjunctivitis, an allergic reaction to compositions after the carrier of the composition of conditions and polynucleotides are used to condition allergic rhinitis or conjunctivitis, an allergic reaction to compositions and conditions and polynucleotides are used to condition allergic rhinitis or conjunctivitis, an allergic reaction to eccema or urticaria (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition for treating immunoglobulin (Ig) E-mediated disorder such as anaphylactic shock, allergic rhinitis and conjunctivitis, comprises a polypeptide that includes CH1 and/or CH4 domains of IgE molecule coupled to a carrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

                                                                                                                                                                                   reduces its infectivity, competing with cell surface ICAM I for binding sites, interfering with virus entry or uncoating and directing premature release of viral RNA and formation of empty capsids. Expression of the immunoadhesin in plants would be tetrameric, rather than dimeric. Immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin J chain increases the stability of the immunoadhesin in the mucosal environment. Production is significantly less expensive in plants than in animal cell culture and production in plants is afer for human use, since plants are not known to harbor any animal viruses. The present the immunosity is that of a human immunoglobulin protein sequence, useful to
                                                                                                                                                                                                                                                                                                                                                                          reduces its infectivity, competing with cell surface ICAM-1 for binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunoadhesin for treating human rhinovirus infection comprises chimeric intercellular adhesion molecule-1, and optionally a J chain and secretory component in association -
                                                                                                                                                                                                                                                                                                                                                                                                                            chimeric ICAM-1 molecule. The immunoadhesin has plant-specific glycosylation and virucide activity. The immunoadhesin is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                             immunoglobulin heavy chain; and (b) optionally a J chain and secretory component associated with the chimeric ICAM-1 molecule. The immunoadhesin has plant-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure;
                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an immunoadhesin comprising:

(a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising rhinovirus receptor protein linked to at least a portion of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-APR-2000; 2000US-200298P

and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe

                                                                                                                                                                                                                                                                          DЬ
                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgB) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains fused to the MIGIS

This invention relates to a novel method for inducing an immune respons, against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentiation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes

The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C1-C2-C3-C4 domains fused to the MIGIS

                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding IgE H-chain and frags. is claimed (AAN40062).

Transformant contg. the DNA is also new, esp. Escherichia coli IFO-
14284, -5 and -6. The transformant may be grown to produce a
polypeptide of immunological or biological activity equivalent to
that of the human IgE H chain. AAN40062 or frags. is pref. linked at a
site downstream from a promoter, e.g. rec A promoter (see AAN40064).
